

Stay always up to Date:

Automatic Update

The new Feature that permanently keeps the Auerswald ISDN Systems at the current Firmware Level.

You like that your PABX of Auerswald and also your system telephones always have the latest firmware?

And all this without manual operation or additional service efforts?

Then simply use the new automatic update of Auerswald.

Why Automatic Update?

New developments in the telecommunication industry happen in increasingly shorter time periods. Products being stored at the reseller cannot be up-to-date when installing them. However, with a software update it is possible to update these products to the latest status.

The new automatic update of Auerswald makes sure that the latest features and changes in the system and the system telephones will be available right after the installation.

It works!

Besides of the automatic update of the firmware when starting the PABX, an automatic update can also be configured for defined periods of time. So a system already in use can also profit from new developments.

The configuration software of the PABX makes it possible to activate that the PABX will regularly call the update server independently of the activation by the user. If a new software version is available, an update will be executed.

To use the automatic update you have to define the update intervals in the configuration program *COMset* first. There are different periods of time available. To leave the current operation of the PABX undisturbed, a time frame during the day can be selected when the update has to be done.

If no automatic update has to be used, this function could also be switched off.

News also for the System Telephones

Also all COMfort 1000 / 1200 / 2000 connected to the systems can automatically be supplied with the latest firmware. A specific, time and cost saving method has been developed for this task.

At the beginning the PABX controls the update of the first system telephone. After a successful update the first system telephone distributes the new firmware to 2 additional system telephones via an internal connection free of charge. These 2 system telephones transfer the new firmware to 2 additional system telephones. Thanks to this avalanche procedure especially developed for the system telephones *COMfort 1000 / 1200 / 2000* it will be possible to update all connected system telephones with only one update procedure. So the whole system telephone fleet will be refreshed to the latest software status within a very short time frame.

Also for this update the time periods and the time of day are selectable.

Supported PABX Systems

The automatic update is available for *COMcompact 2206 USB*, *COMcompact 4410 USB*, *COMcompact 4406 DSL*, *COMmmander Basic* and *COMmmander Basic 19"*. The PABX firmware version has to be at least 1.4E. You can update older versions manually first free of charge. For the ISDN connection to the Auerswald server (telephone number +49-(0) 5306-9200-XXX) or to your local update number a normal connection charge will be payable.

The configuration software *COMset* version 2.3.19 or later can be used. It is available for download under www.auerswald.de or can be ordered on a CD-ROM from your local Auerswald distribution partner.
